The invention relates to novel isolated polynucleotides and polypeptides encoded by them. Also included are mutants or variants of the proposed by them. Also included are mutants or variants of the polynucleotides and polypeptides. A polypeptide of the invention has virucide, anti-HIV, cytostatic, antiinflammatory, antiallergic, immunosuppressive, antiarteriosclerotic, hypotensive, osteopathic, antiandamic, neuroprotective, nootropic, antiparkinsonian, antiasthmatic, haemostatic, antidiabetic, and cardiant activity. The composition and methods are useful in diagnostics, forensics, gene or chromosome mapping, dentification of mutations responsible for genetic disorders or other traits, in assessing biodiversity, or in producing many other types of data and products dependent on DNA and amino acid sequences. They may also be used in preventing or treating diseases (e.g. HIV and other viral infections, cancer, inflammation, allergies, graft rejection, atherosclerosis, hypertension, osteoporosis, anaemia, Alzheimer's disease, parkinson's disease, asthma, diabetes, myocardial infarction or haemophilia). They may also be used as targets in drug screening. The present sequence represents a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DYRDRIRLFENGSLLLSDLQLADEGTYEVEISITDDTFTGEKTINLTVDVPISRPQVLVA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of a novel human immunoglobulin domain-containing cell surface recognition molecule known as INSP052. The polypeptide is useful as immunoglobulin domain-containing cell surface recognition molecule. The sequences may also be used in therapy or diagnosing a disease or in the manufacture of a medicament for treating a disease. The disease or in the manufacture of autoimmune/inflammatory, cardiovascular, neurological, psychiatric, developmental, genetic or metabolic disorder, an infection or other to the structural integrity and homeostatic functioning of most tissues. The present sequence is a polypeptide shown in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DYRDRIRLFENGSLLLSDLQLADEGTYEVEISITDDTFTGEKTINLTVDVPISRPQVLVA 120

The present invention provides the protein and coding sequences of a novel human immunoglobulin domain-containing cell surface recognition molecule known as INSP052. The polypeptide is useful as immunoglobulin domain-containing cell surface recognition molecule. The sequences may also be used in therapy or diagnosing a disease or in the manufacture of a medicament for treating a disease. The disease or in the manufacture of autoimmune/inflammatory, cardiovascular, neurological, psychiatric, developmental, genetic or metabolic disorder, an infection or other pathological condition. The polypeptides and nucleic acids are essential to the structural integrity and homeostatic functioning of most tissues. The present sequence is a polypeptide shown in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DYRDRIRLFENGSLLLSDLQLADEGTYEVEISITDDTFTGEKTINLTVDVPISRPQVLVA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                153

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel isolated polynucleotides and polypeptides encoded by them. Also included are mutants or variants of the encoded by them. Also included are mutants or variants of the polynucleotides and polypeptides. A polypeptide of the invention has virucide, anti-HV, cytostatic, antiinflammatory, antiallergic, immunosuppressive, antiarteriosclerotic, hypotensive, osteopathic, antiantamenic, neuroprotective, nootropic, antiparkinsonian, antiasthmatic, hemostatic, antidiabetic, and cardiant activity. The composition and methods are useful in diagnostics, forensics, gene or chromosome mapping, identification of mutations responsible for genetic disorders or other traits, in assessing biodiversity, or in producing many other types of data and products dependent on DNA and amino acid sequences. They may also be used in preventing or treating diseases (e.g. HIV and other viral infections, cancer, inflammation, allergies, graft rejection, atherosclerosis, hypertension, osteoporosis, anemia, Alzheimer's disease, parkinson's disease, asthma, diabetes, myocardial infarction or haemophilial. They may also be used as targets in drug screening. The

The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Y;

The present invention provides the protein and coding sequences of a novel human immunoglobulin domain-containing cell surface recognition molecule known as INSPOS2. The polypeptide is useful as immunoglobulin domain-containing cell surface recognition molecule. The sequences may also be used in therapy or diagnosing a disease or in the manufacture of a medicament for treating a disease. The disease or in the manufacture of autoimmune/inflammatory, cardiovascular, neurological, psychiatric, developmental, genetic or metabolic disorder, an infection or other pathological condition. The polypeptides and nucleic acids are essential to the structural integrity and homeostatic functioning of most tissues. The present sequence is a polypeptide shown in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New INSP052 polypeptides and nucleic acids, useful in diagnosing and treating cell proliferative, autoimmune/inflammatory, cardiovascular, neurological, psychiatric, developmental, genetic or metabolic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

requences in the process of discovering other novel polynucleotides; for sequences in the process of discovering other novel polynucleotides; for selecting and making oligomers for attachment to a gene chip or other support, including for examination of expression patterns; to raise antiportion antibodies using DNA immunisation techniques; and as an antigen to raise anti-DNA antibodies or elicit another immune response. The polynucleotides and polypeptides can also be used as nutritional sources or supplements, e.g. as a protein or amino acid supplement, as a carbon source, as a nitrogen source or as a source of carbohydrates. The compositions are useful for promoting better or faster closure of nonhealing wounds, for the generation and resement of lung or liver fibrosis, protection or regeneration and treatment of lung or liver fibrosis, protection or regeneration and treatment of lung or liver fibrosis, protection or regeneration and treatment of lung or liver fibrosis, protection or regeneration and treatment of lung or liver fibrosis, protection or regeneration and treatment of lung or liver fibrosis, spetemic cytokine damage. The compositions can also be used to treat inflammatory conditions (e.g. arthritis, inflammatory bowel disease or crown graft versus host disease. The present sequence represents a novel than polypeptide sequence from the present invention. N.B. The sequence for this patent were obtained from the USPTO web site from an equivalent US patent US20040048249A1. 88888888888888888888888888888888888

2004-143291/14. WPI; 2004-143291/ N-PSDB; ADM87569.

New isolated polynucleotides and polypeptides, useful for treating, e.g. cancer, lung or liver fibrosis, arthritis, inflammatory bowel disease, Crohn's disease, rheumatoid arthritis, diabetes mellitus type 1 or graft versus host disease.

Example 2; SEQ ID NO 880; 591pp; English.

use; as markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags to identify chromosomes or to map related gene chromosome markers or tags to identify chromosomes or to map related gene chromosome with endogenous DNA sequences in patients to identify potential genetic disorders; as probes to hybridise and discover genes, related DNA sequences; as a source of information to derive PCR genes, related DNA sequences; as a probe to subtract-out known sequences in the process of discovering other novel polymuclectides; for selecting and making oligomers for attachment to a gene chip or other support, including for examination of expression patterns; to raise anti-DNA antibodies or elicit another immune response. The protein antibodies and polymetides can also be used as an untritional sources or supplements, e.g. as a protein or amino acid supplement, as a carbon source, as a nitrogen source or as a source of carbohydrates. The compositions are useful for promoting better or faster closure of non-healing wounds, for the generation and regeneration of tissues, for gut reperfusion injury in various tissues, and conditions resulting from systemic cytokine damage. The compositions can also be used to treat inflammatory conditions (e.g. architis, inflammatory bowel disease or Crohn's disease or crohn's disease or crohn's disease. The present sequence from the present expressed sequence the delian and may be an expressed sequence the delian and may be an expressed the man are sequence from the present expressed sequence of extressed sequence of the delians and the delians of the delians and the delians of the delians are sequence. The compositions can also be used to treat inflammatory conditions (E.g. archititis, inflammatory bowel disease or conditions fer the sequence expressed sequence the sequence of the deliance of The present invention describes an isolated polynucleotide (I): (a) comprising a nucleotide sequence selected from SEQ ID NO:1-244; or (b) which encodes a polypeptide with biological activity, where the polynucleotide hybridises to (I) under stringent hybridisation conditions or has greater than 99% sequence identity with (I). (I) has respiratory, cytostatic, antiarthritic, antiantlammatory, gastrointestinal, antibarthritic, antiantlammatory, and troin the secondary antibacterial, immunosuppressive, antidiabetic and antirheumatic activities, and can be used in gene therapy. (I) can be used for sectivities polynucleotides encoding chimeric or fusion proteins and heterologous protein sequences. The polynucleotides can be used to express recombinant protein for analysis, characterisation or therapeutic use; as markers for tissues in which the corresponding protein is invention. N.B. The sequences for this patent were obtained USPTO web site from an equivalent US patent US20040048249A1.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(first entry) (ARES-) ARES TRADING SA. Fagan RJ, WPI: 2003-903655/82. N-PSDB; ACH01277. WO2003093316-A2 Unidentified. 13-NOV-2003. 22-APR-2004 Davids AR, ABG75379; RESULT 1 ABG75379 

The present invention provides the protein and coding sequences of a novel human immunoglobulin domain-containing cell surface recognition molecule known as INSPOS. The polypeptide is useful as immunoglobulin domain-containing cell surface recognition molecule. The sequences may also be used in therapy or diagnosing a disease or in the manufacture of a medicament for treating a disease. The disease is a cell proliferative, autoimmune/inflammatory, cardiovascular, neurological, psychiatric, developmental, genetic or metabolic disorder, an infection or other pathological condition. The polypeptides and nucleic acids are essential to the structural integrity and homeostatic functioning of most tissues.

The invention relates to novel isolated polynucleotides and polypeptides encoded by them. Also included are mutants or variants of the encoded by them. Also included are mutants or variants of the polyneptides. A polypeptide of the invention has virucide, anti-HIV, cytostatic, antiinflammatory, antiallargic, immunosuppressive, antiarteriosclerotic, hypotensive, osteopathic, antianaemic, neuroprotective, nootropic, antiparkinsonian, antiasthmatic, haemostatic, antidiabetic, and cardiant activity. The composition and methods are useful in diagnostics, forensics, gene or chromosome mapping, identification of mutations responsible for genetic disorders or other traits, in assessing biodiversity, or in producing many other types of data and products dependent on DNA and amino acid sequences. They may also be used in preventing or treating diseases (e.g. HIV and other viral infections, cancer, inflammation, allergies, graft rejection, atheorems, ansemia, Alzheimer's disease, parkinson's disease, asthma, diabetes, myocardial infarction or haemophilia). They may also be used as targets in drug screening. The present sequence represents a polypeptide of the invention.

The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antiinflammatory, neuroprotective, antianaemic, cytoscatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoleiti, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.

The invention relates to novel isolated polynucleotides and polypeptides encoded by them. Also included are mutants or variants of the polynucleotides and polypeptides. A polypeptide of the invention has virucide, anti-HIV, cytostatic, antiinflammatory, antiallergic, immunosuppressive, antiarteriosclerotic, hypotensive, osteopathic, antianesmic, neuroprotective, noctropic, antiparkinsonian, antiasthmatic, haemostatic, antidiabetic, and cardiant activity. The composition and methods are useful in diagnostics, forenaics, gene or chromosome mapping, identification of mutations responsible for genetic disorders or other traits, in assessing biodiversity, or in producing many other types of data and products dependent on DNA and amino acid sequences. They may also be used in preventing or treating diseases (e.g. HIV and other viral
   immunosuppressive, antiarteriosclerotic, hypotensive, osteopathic, antianaemic, neuroprotective, nootropic, antiparkinsonian, antiasthmatic; haemostatic, antidiabetic; cardiant, HIV, viral infection; cancer, inflammation; allergy, gaft rejection, atherosclerosis, hypertension; osteoporosis, anaemia; Alzheimer's disease, Parkinson's disease, asthma; diabetes, myocardial infarction; haemophilia.
  New isolated polypeptides and polynucleotides useful in diagnostics, forensics, in preventing or treating diseases such as HIV and cancer, and

The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% or 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, sequence of the invention.

  The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.

  human; virucide; anti-HIV; cytostatic; antiinflammatory; antiallergic; immunosuppressive; antiatreriosolerotic; hypotensive; osteopathic; antianaemic; neuroprotective; nootroppic; antiaremic; antiathmatic; haemostatic; antidiabetic; cardiant; HIV; viral infection; cancer; inflammation; allergy; graft rejection; atherosolerosis; hypertension; osteoporosis; anaemia; Alzheimer's disease; Parkinson's disease; asthma; diabetes; myocardial infarcion; haemophilia.
  The invention relates to novel isolated polynucleotides and polypeptides encoded by them. Also included are mutants or variants of the polynucleotides and polypeptides. A polypeptide of the invention has virucide, anti-HIV, cytostatic, antiinflammatory, antiallergic, immunosuppressive, antiarteriosclerotic, hypotensive, osteopathic, antianaemic, neuroprotective, nootropic, antiparkinsonian, antiasthmatic, antianaemic, and cardiant activity. The composition and methods are useful in diagnostics, foreniscs, gene or chromosome mapping, identification of mutations responsible for genetic disorders or other traits, in assessing biodiversity, or in producing many other types of
